

AZURE SERVICES REQUIRED

Project Title: Azure Monitor Alert Action Group and On-Call Routing

Resource Group: rg-monitor-project

Submitted By: T269[24CC3046-P065]

Course/Section: Microsoft Azure S57

To successfully implement the automated monitoring and notification pipeline for the **Azure Monitor Alert Action Group and On-Call Routing** project, specific Microsoft Azure cloud components are utilized. The table below outlines each required Azure service and its precise purpose within the architecture.

Azure Service	Purpose
Azure Virtual Machine	Used as the resource being monitored (monitor-vm) and for conducting CPU load testing to trigger performance thresholds.
Azure Monitor	Monitors the VM metrics, processes telemetry data, and evaluates the configured CPU alert condition.
Log Analytics Workspace	Stores and analyzes detailed monitoring and log data collected from the cloud environment.
Data Collection Rule (DCR)	Defines precisely how monitoring data and telemetry are collected from the target resource and sent to the workspace.
Action Groups	Sends instant notifications when an alert condition is triggered and supports team/on-call routing workflows.
Resource Group	Organizes and manages all related project resources together under a single logical container (rg-monitor-project).
